# Modeling multimodal processing in Simultaneous Interpreting

Kilian G. Seeber  
FTI – University of Geneva

## Summary

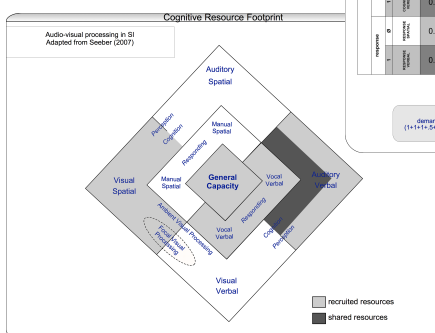

Simultaneous conference interpreting is a complex language-processing task combining language comprehension and language production in real time. One of the factors with the potential to compound the complexity of this task is the integration of visual information in the process. Whether it is facial expressions, gestures, images or text, the processing of visual information has been shown to interact with auditory information when processed simultaneously. The question about the extent to which the availability of such visual information helps or hinders comprehension in simultaneous interpreting is as yet unclear. This is an attempt to model these parameters.

## Background and Theory

- In natural conversation settings auditory speech is normally accompanied by visual speech information provided by the speaker
- Visual information supports and facilitates the perception of auditory speech
- Speech reading is robust both in the comprehension of spoken and sung text
- The human processor seems capable of integrating different cues within one and the same modality (->multicue integration) as well as between or among several modalities (-> multimodal integration) without much effort.
- Single-resource theory predicts early overload during *multicue* and *multimodal* integration
- Multiple-resource theory predicts early overload only during *multicue* integration

## Model

SI with visual (spatial) input

Conflict Matrix for Simultaneous Interpreting (with visual input)

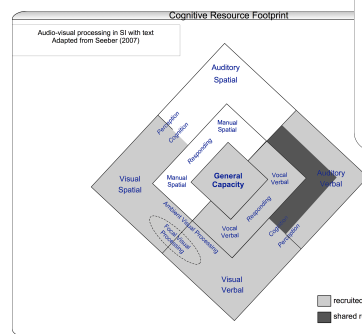

Adaptation of a typical conflict matrix based upon the three primary dimensions of the cognitive resource model (Waters 2002)

		Listening comprehension						Production & monitoring					
		perceptual			cognitive			perceptual			cognitive		
modality	input	visual spatial	manual spatial	auditory spatial	visual verbal	manual verbal	auditory verbal	visual spatial	manual spatial	auditory spatial	visual verbal	manual verbal	auditory verbal
		production	visual spatial	0.8	0.6	0.6	0.4	0.7	0.5	0.4	0.2		
manual spatial	0.6		0.8	0.4	0.6	0.5	0.7	0.2	0.4				
auditory spatial	0.6		0.4	0.8	0.4	0.7	0.5	0.4	0.2				
response	visual spatial	0.4	0.6	0.4	0.8	0.5	0.7	0.2	0.4				
	manual spatial	0.7	0.5	0.7	0.5	0.8	0.6	0.6	0.4				
	auditory spatial	0.5	0.7	0.5	0.7	0.6	0.8	0.4	0.6				
recovery	visual spatial	0.4	0.2	0.4	0.2	0.6	0.4	0.8	0.6				
	manual spatial	0.2	0.4	0.2	0.4	0.4	0.6	0.4	0.6				
	auditory spatial	0.2	0.4	0.2	0.4	0.4	0.6	0.4	0.6				

Total interference score = demand vectors + conflict coefficients  
 $(1+1+1+2+1+5+5+1) + (4+5+2+8+7+4+8+7+4+5+5+4+7+8+8) = 54.8$

## Model

SI with visual (verbal) input

Conflict Matrix for Simultaneous Interpreting (with visual/verbal input)

Adaptation of a typical conflict matrix based upon the three primary dimensions of the cognitive resource model (Waters 2002)

		Listening & reading comprehension						Production & monitoring					
		perceptual			cognitive			perceptual			cognitive		
modality	input	visual spatial	manual spatial	auditory spatial	visual verbal	manual verbal	auditory verbal	visual spatial	manual spatial	auditory spatial	visual verbal	manual verbal	auditory verbal
		production	visual spatial	0.8	0.6	0.6	0.4	0.7	0.5	0.4	0.2		
manual spatial	0.6		0.8	0.4	0.6	0.5	0.7	0.2	0.4				
auditory spatial	0.6		0.4	0.8	0.4	0.7	0.5	0.4	0.2				
response	visual spatial	0.4	0.6	0.4	0.8	0.5	0.7	0.2	0.4				
	manual spatial	0.7	0.5	0.7	0.5	0.8	0.6	0.6	0.4				
	auditory spatial	0.5	0.7	0.5	0.7	0.6	0.8	0.4	0.6				
recovery	visual spatial	0.4	0.2	0.4	0.2	0.6	0.4	0.8	0.6				
	manual spatial	0.2	0.4	0.2	0.4	0.4	0.6	0.4	0.6				
	auditory spatial	0.2	0.4	0.2	0.4	0.4	0.6	0.4	0.6				

Total interference score = demand vectors + conflict coefficients  
 $(1+1+1+2+1+5+5+1) + (4+5+2+8+7+4+8+7+4+5+5+4+7+8+8) = 54.8$

## Discussion and Conclusion

Audio-visual information can be integrated even when the information coming from the two channels is not perfectly synchronous.

Audio-visual information presented between a 40ms audio lead and a 240ms audio lag, in other words within a window of just under 300ms.

Leading auditory information hinders integration while leading visual information enhances integration.

- A multimodal facilitation effect during SI with text is contingent on the synchronicity of the two signals (e.g., text and speech)
- Asynchrony of signals on different channels is expected to increase cognitive load
- Interpreter's inability to keep this synchrony during SI with text would explain the perceived increase in task difficulty as compared to SI without text
